Best Practice

Allana Buick & Bers, Inc. (ABBAE) is a Registered Provider with the American Institute of Architects Continuing Education Systems. Credit earned on completion of this program will be reported to CES Records for AIA members. Certificates of completion for non-AIA members are available on request.

This program is registered with the AIA/CES for continuing professional education. As such, it does not include content that me be deemed or construed to be an approval or endorsement by the AIA of any material of construction or any method or manner of handling, using, distributing, or dealing in any material or product. Questions related to specific materials, methods, and services will be addressed at the conclusion of this presentation.

Karim P. Allana, PE, RRC, RWC

• Education: B.S., Civil Engineering, Santa Clara University

Registration: P.E., Civil Engineering, California, Washington,

Nevada, and Hawaii

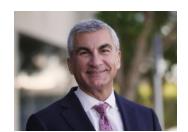

Certification: Registered Roof Consultant (RRC), Roof Consultants

Institute, and Registered Waterproofing Consultant (RWC)

- CEO and Senior Principal at Allana Buick & Bers.
- Former Turner Construction Employee (Project Engineering and Superintendent)
- Over 37 years experience providing superior technical standards in all aspects of building technology and energy efficiency.
- Principal consultant in forensic investigations of building assemblies, failure analysis, evaluation and design of building infrastructure and building envelope evaluation and design.
- Expert in all aspects of building envelope technology.
- Completed numerous new construction, addition, rehabilitation, remodel and modernization projects for public and private sector clients.
- Specialization in siding, roofing, cement plaster, wood, water intrusion damage, window assemblies, storefronts, below grade waterproofing, energy efficiency, solar engineering and complex building envelope and mechanical assemblies.

ABBAE Firm Overview

- Allana Buick & Bers (ABBAE) is an Architectural Engineering firm specializing in Building Envelope Systems
- ABBAE is one of the 5 largest building envelope consultants in the country
- ABBAE has over 33 years of experience & over 12,500 projects
- ABBAE is also a leading Forensic Defect firm with hundreds of forensic projects (litigation)
- Locations 16 offices across California,
 Nevada, North Carolina, Oklahoma, Oregon,
 Texas, Virginia, Washington, Colorado

and Hawaii

Staff & In-House Expertise

- Licensed Professional Engineers – Civil, Structural, and Mechanical
- Registered Architects
- Building Enclosure Commissioning Process Providers (BECxPs)
- Registered Building Envelope Consultant (RBEC)
- Registered Roofing Consultants (RRCs)
- Registered Waterproofing Consultants (RWCs)
- Registered Exterior Wall Consultant (REWCs)

- Registered Roof Observers (RROs)
- Certified Exterior Insulation and Finish System (EIFS) inspectors
- Curtain Wall Specialists
- ICC Certified Building Inspectors
- Quality Assurance Monitors
- Water Testing Experts
- Leak Investigation and Diagnosis Experts
- Infrared Imaging and Nuclear Moisture Scanning Experts

ABBAE Building Expertise

- Building Envelope Systems
 - Roofing Systems
 - High-Slope/Low-Slope Roofs
 - Green/Garden Roofs
 - Drainage Systems
 - Pedestrian Plazas
 - Exterior Wall Systems
 - Wall Cladding /Siding/GFRC/pre-cast
 - EIFS/cement plaster/stucco
 - Sheet Metal Flashings
 - Windows and Glazing Systems
 - Punched Windows
 - Curtain Wall/Window Wall Systems
 - Sliding Glass Doors
 - Skylights

- Building Envelope Systems (cont'd)
 - Roofing & Waterproofing Systems
 - Deck/Balcony/Lanai Waterproofing
 - Podium Waterproofing
 - Pool/Spa Deck Waterproofing
 - Above-Grade/Below-Grade Waterproofing
 - All types of low and steep sloped roofing
 - Commissioning BECx
 - OPR/BOD/Commissioning Plan
 - Mechanical/HVAC Systems
 - HVAC design
 - Plumbing systems
 - Commissioning and testing

ABBAE Core Services

- Consulting and third-party peer review services
- Engineer of record for building envelope systems
- Contract administration services
- Inspection services (usually direct with owner)
- Air and water performance testing
- Mock-up design, observation, and testing
- Building assessments and forensic investigations
- Litigation support and expert witness services
- Educational seminars with AIA credits

Objectives

- Review Frame Types
- Pros and Cons of Vinyl Windows
- Technical Aspects of Vinyl Windows
 - Design Considerations
 - External Glazing Tape vs. Internal Glazing Tape
- Understanding Why Vinyl Windows Fail
 - Glazing Tape
 - IGU
 - Frame
 - Reinforcement
 - Joinery (Mulled and Coped Joints)
- Case Study
- Conclusions

Windows Are Important

- Windows are among the most complex components in a building.
- At several hundred dollars to thousands of dollars apiece, windows are also among the most expensive.
- In addition to the important architectural and aesthetic contribution they make, windows have very far-reaching energy consequences.
- The number of windows, total area, and orientation to the sun can make or break the energy efficiency of a highperformance building.

Vinyl Windows – Are They Reliable?

- The Federal Trade Commission recently issued a publication that endorsed vinyl-frame windows because they "insulate well and don't need painting."
- While Vinyl Windows offer many energy efficiency and maintenance benefits... You must ask:
 - As a construction professional am I opening myself to liability specifying vinyl windows?
 - Do the vinyl windows actually perform as advertised?
 - Do they provide the Owner with a product that has longevity and is adverse to defects?

Window Considerations

- ✓ Type of Construction (height, use, etc)
- ✓ Acoustical
- √ Thermal Resistance
- ✓ Orientation
- ✓ Air Infiltration
- ✓ Water Resistance
- ✓ Condensation Resistance
- ✓ Wind Resistance
- ✓ Glazing (Size and Type)
- ✓ Operation (31 types defined by NAFS)
- ✓ Sizing
- ✓ Aesthetic
- √ Economics
- ✓ Hardware Selection

But don't worry...

There is help...

A Ridiculous Amount to Know About Windows

A list of ASTM Standard Test Methods Relevant to Building **Envelope Windows**

ASTM C 162 Standard Terminology of Glass and Glass Products ASTM C 509 Standard Specification for Elastomeric Cellular Preformed Gasket and ASTM C 1503 Standard Specification for Silvered Flat Glass Mirror Sealing Material ASTM C 510 Standard Test Method for Staining and Color Change of Single- or **Multicomponent Joint Sealants** ASTM C 542 Standard Specification for Lock-Strip Gaskets ASTM C 716 Standard Specification for Installing Lock-Strip Gaskets and Infill ASTM C 717 Standard Terminology of Building Seals and Sealants ASTM C 793 Standard Test Method for the Effects of Accelerated Weathering on **Elastomeric Joint Sealants**

Window Frame Considerations

The window frames do more than hold the glass in place and allow the window to open and close.

- ✓ They are an important part of a window's overall thermal performance.
- ✓ The type of frame helps dictate how much maintenance the window will need over its lifetime.
- ✓ Equally important to the thermal performance of the frame is the water resistance performance.

Frame materials include:

- Wood
- Aluminum
- Vinyl
- Fiberglass
- Both vinyl- and aluminum-clad substrates

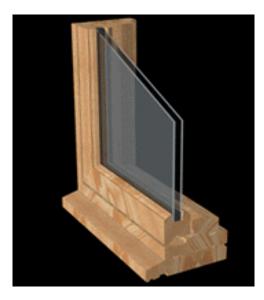

Wood

- The traditional window frame material
- Wood frames are high maintenance, they require sanding and staining, and the outer frame may require refinishing every few years.

 Clad the exterior face of the frame with either vinyl or aluminum, creating a permanent weather-resistant surface.

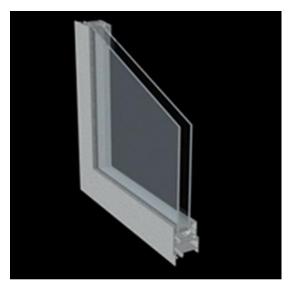

Aluminum

 Aluminum window frames are light, strong, durable but with high thermal conductance.
 They readily conduct heat, greatly raising the overall Ufactor of a window unit.

Aluminum with Thermal Break

 The most common solution to the heat conduction problem of aluminum frames is to provide a thermal break by splitting the frame components into interior and exterior pieces and use a less conductive material to join them.

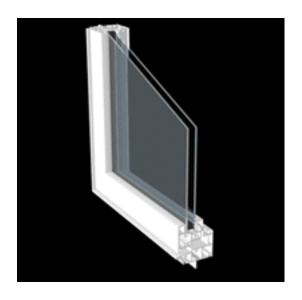

Vinyl

- Vinyl does not conduct heat very well and is therefore considered a good thermal insulator.
- Vinyl comes in different wood grain finishes and does not require painting or finishing.

Insulated Vinyl

 In insulated vinyl frames, the non-draining hollow cavities of the frame are filled with insulation making them thermally superior to standard vinyl and wood frames. Usually these high performance frames are used with high performance glazings.

Fiberglass

- Generally the more expensive option.
 They don't need to be painted or caulked often, and they have high insulation values.
- Fiberglass expands and contracts almost the same as window glass in extreme temperature changes, which contributes to the longevity of the seals around the glass.

Use of two or more frame materials

Composite

 Very stable, and have the same or better structural and thermal properties as conventional wood, with better moisture resistance and more decay resistance.

Configuration Types

AAMA/WDMA/CSA 101/I.S. 2/A440-05 Product Type Designation System							
TYPE CODE	WINDOW OR GLASS DOOR TYPE	TYPE CODE	WINDOW OR GLASS DOOR TYPE				
Slid	ing Seal Window Products	Specialty Window Products					
Н	Single/Double/Triple Hung	BW	Basement Window				
HS	Horizontal Sliding	HE	Hinged Egress (rescue window)

SHW	Side-Hinged Inswinging	Door Products					
TH	Top-Hinged	ATD	Architectural Terrace Door				
1	Fixed Window Products	FD	Fixed Door				
FW	Fixed	SHD	Side-Hinged Door				
	Unit Skylight Products	LW SHD	Limited Water Side-Hinged Door				
SKG	Skylights/Glass Glazed	SLT	Side lite				
SKP	Skylights/Plastic Glazed	SD	Sliding Door				
RW	Roof Window	DASHD	Dual Action Side Hinged Door				
Dual Action Window Products		LW DASHD	Limited Water Dual Action				
DAW	Dual Action Window	LW DASHD	Side-Hinged Door				

(NOTE: The products in blue are new or revised in the 2005 standard.)

^{*} The Specialty Products category was established to clarify how performance is to be measured for size and shape variations of other product types (e.g., half-rounds, trapezoids and other configurations) and is congruent with current NFRC terminology. Note that this does not replace the "Specialty Window Products" grouping defined in the 1997 standard, where the existing categories for basement, greenhouse, jalousie, etc. windows are still applicable.

Objectives

- Review Frame Types
- Pros and Cons of Vinyl Windows
- Technical Aspects of Vinyl Windows
 - Design Considerations
 - External Glazing Tape vs. Internal Glazing Tape
- Understanding Why Vinyl Windows Fail
 - Glazing Tape
 - IGU
 - Frame
 - Reinforcement
 - Joinery (Mulled and Coped Joints)
- Case Study
- Conclusions

Facts About Vinyl Windows - Pros

Pros:

- Vinyl windows and doors are energy efficient during both the manufacturing and use phases of their lifecycle.
- Vinyl products have low embodied energy meaning the amount of energy required to convert the raw material into an end product is lower than most alternatives.
- Great condensation resistance. The material is less conductive than aluminum.
- Can reduce noise transmission.
- Flexible and varied design options.

Facts About Vinyl Windows - Cons

Cons:

- Manufacturing techniques and levels of quality standards vary greatly.
- Many mass produced vinyl windows are made with lower grade materials.
- PVC in not as rigid as wood or aluminum and thus is only effective for relatively small windows. (They can be fitted with internal metal stiffners.) Vinyl windows will also require thicker frames.
- PVC is a little tricky for sealant adhesion sometimes caulking materials doesn't stick to it. When working with any substrate, and especially PVC, you must do adhesion tests before applying sealants.

Facts About Vinyl Windows - Cons

Cons:

- PVC is a thermoplastic with a relatively low melting point, about 212°F. It can begin to soften 149°F and if it heats up too much, it can bend and "take a set".
- Dark-colored vinyl if installed in a location where it receives reflected light from a window, can reach 219°F.
- PVC has a greater coefficient of thermal expansion than wood, aluminum, or glass. This means it shrinks and grows more with temperature changes. Glazing sealants can shear because the PVC is moving against the more stable glass which can result in leaks around the glass.
- Complex frame geometries make for challenging coped joinery.

Objectives

- √ Hardware Selection

Technical Aspects of Vinyl Windows

- Design Pressures
- External Glazed vs. Internal Glazed

These are commonly misunderstood!

Design Pressures

Class R LC HC AW

Design Pressure		Structural (150% of DP)		Water Resistance Test Pressure (15% of DP)	
PSF	MPH	PSF	MPH	PSF	MPH
15	77	22.5	94	2.9	34
25	99	37.5	121	3.75	38
30	108	45	133	4.5	42
40	125	60	153	8	56

R15 - WRTP is a minimum 2.9 PSF

AW - WRTP is 20% of DP

Maximum WRTP per AAMA is 15 PSF

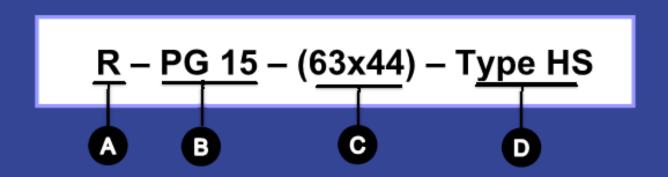

These are "gateway" minimum values.

A designer can specify a higher WRTP requirement.

Example: LC25 with a WPTP requirement of 4.5 PSF

How to Read the Label

PRODUCT KEY

A = Performance Class: R

B = Performance Grade: Design Pressure = 15 psf

C = Maximum Size Tested: Width x Height (63x44)

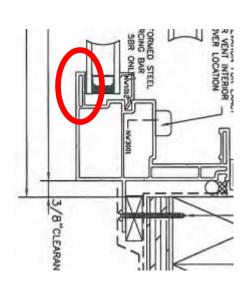

D = Product Type: Horizontal Siding Window (HS)

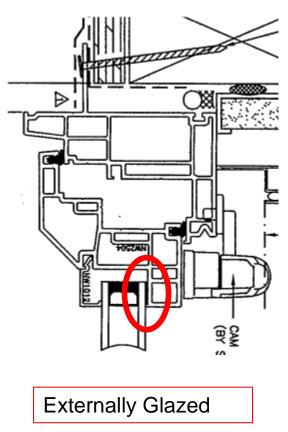

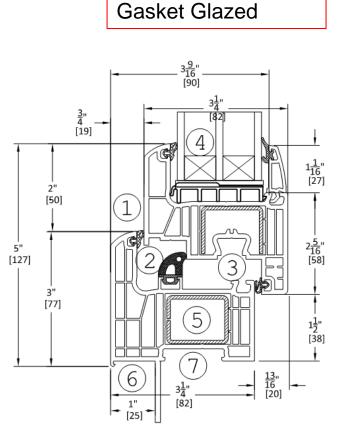

Glazing Tape – Interior vs. Exterior Glazed

 Often the windows are internally glazed, exposing the foam gaskets to UV and water exposure

Internally Glazed

Objectives

- Review Frame Types

Understanding Why Vinyl Windows Fail

- Glazing Tape
- IGU
- Frame Issues
- Reinforcement
- Joinery
 - Mulled Joints
 - Coped Joints

Glazing Tape

- Often the windows are internally glazed, exposing the foam gaskets to UV and water exposure
- Glazing tape needs to adhere a naturally flexible substrate.

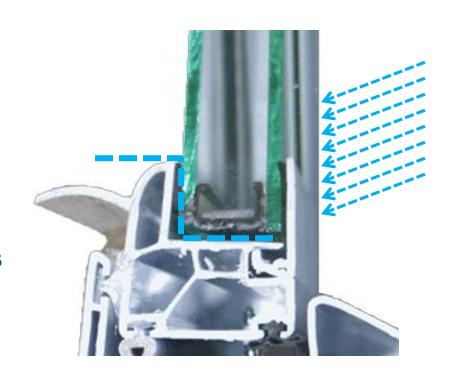

Water Leaks Through Glazing??

- Thermal movement of PVC is up to 7 times that of glass.
- As the temperature changes, the PVC can slide against the glass and puts stress and wear on the glazing sealant.
- The sealant might be only 1/16" thick and eventually is sheared.
- In some cases a vinyl window sash can overflow with just a light spray.

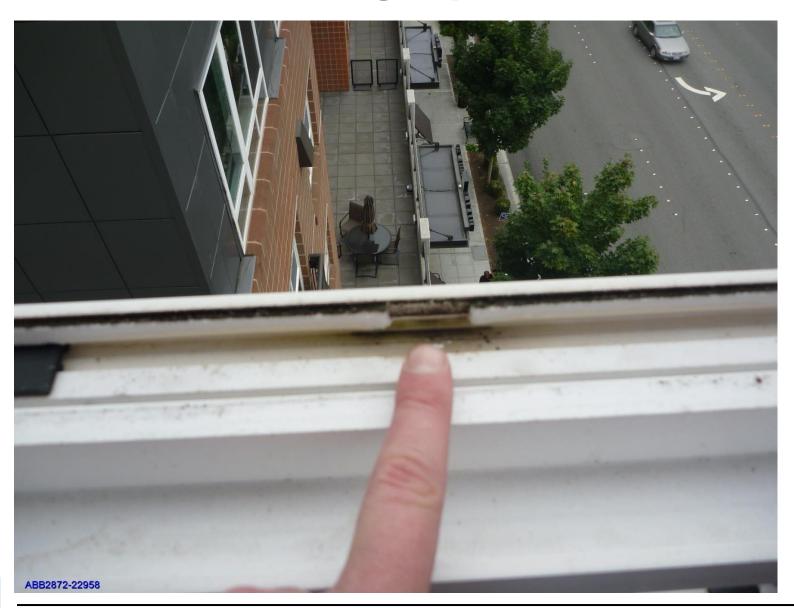

Glazing Tape Issues

Glazing Tape Issues

Insulated Glass (IGU) Seal Failure

- When too much moisture moves through the seal and into the space the desiccant will eventually lose its ability to absorb any more moisture.
- The result of the failure of the seal to keep out excess moisture is that condensation may occur causing the unit to have a fogged appearance.
- Premature failure of sealed units is usually caused by:
 - Poor design of the unit so that it will not pass the standard ASTM tests recommended by the Sealed Insulated Glass Manufacturers Association (SIGMA)
 - Poor workmanship on an individual unit during fabrication
 - Poor frame design which will allow the unit to sit in a high moisture environment

Frame Related Issues

- Older vinyl windows without fused/welded corners are prone to water leaks (screw-spline joinery is prone to leak)
- Screw-spline joinery in some cases not conducive to effective sealing and sealant adhesion
- Welded frame joints can break.

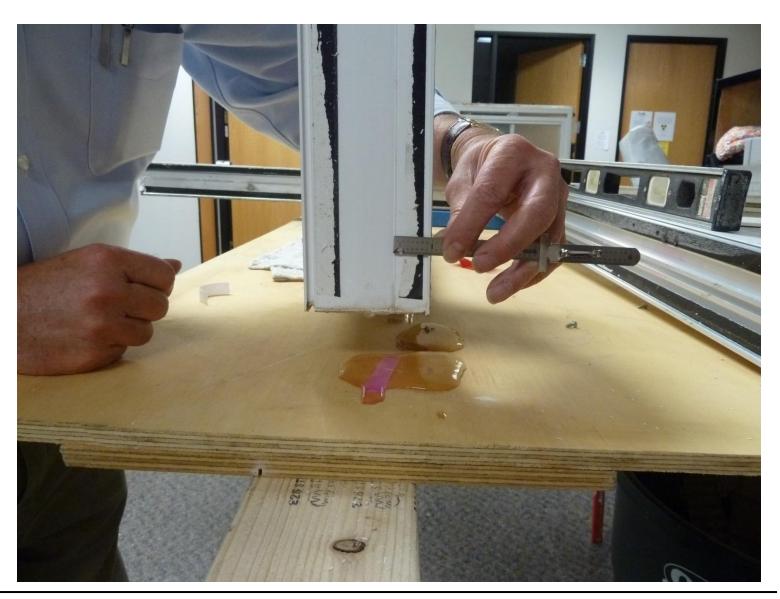

Sill Track Test

 A fixed mullion is not flexible and can crack from movement during transport or due to thermal changes

Frame Failure

Reinforcement Issues

- Reinforcement provides support for glazing and support from wind forces.
- Must have continuous load path.

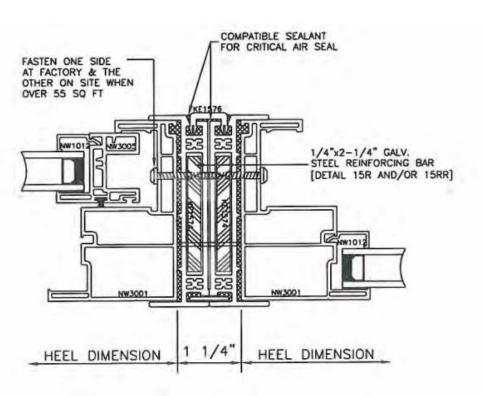

Reinforcement Issues

When 2 to 3 windows are joined together

When 2 to 3 windows are joined together

- Vertical Sliders over Fixed
- What is DP of this assembly?

Water Leaks Through Mulled Joints

- Mullions and capping trim attachments generally must be continuously sealed to the window on the exterior.
- If screws are driven into the window from the interior – this can produce leaks and should be avoided.
- If sealant between the aluminum mullion is not applied, leaks usually occur.

Aluminum stiffner. Note an absence of sealant between the aluminum and the windows.

Mulled windows separated.

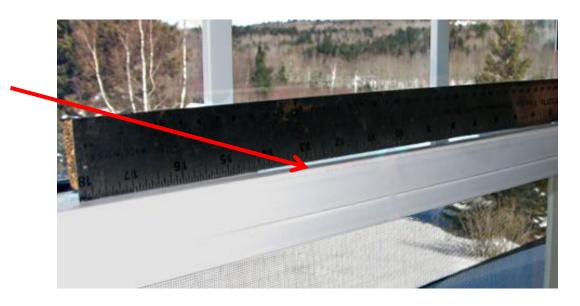

- Individual windows are tested for various ratings
- Mulled windows are often not tested as an assembled unit
- Various modes of failure can result from the untested assembly:
 - Mulled joints can allow water infiltration leading to leaks both inside and behind the flexible flashing
 - Window's welded corners can fail due to stresses

Bowing and Bending of Frame

- Due to the inherent flexibility of vinyl, framing members are often reinforced with steel.
- Framing members with long spans should be designed to limit excessive bending.
- Such bending will often result in reduced performance and the misalignment can make the weather-seals and glazing gaskets non-effective causing excessive condensation, air infiltration, and water infiltration.

Mulled Window

- Mulled joints have a beauty cap or cover
- Window fin is removed in order to join windows

Mulled Windows

Mulled joint cap has been removed

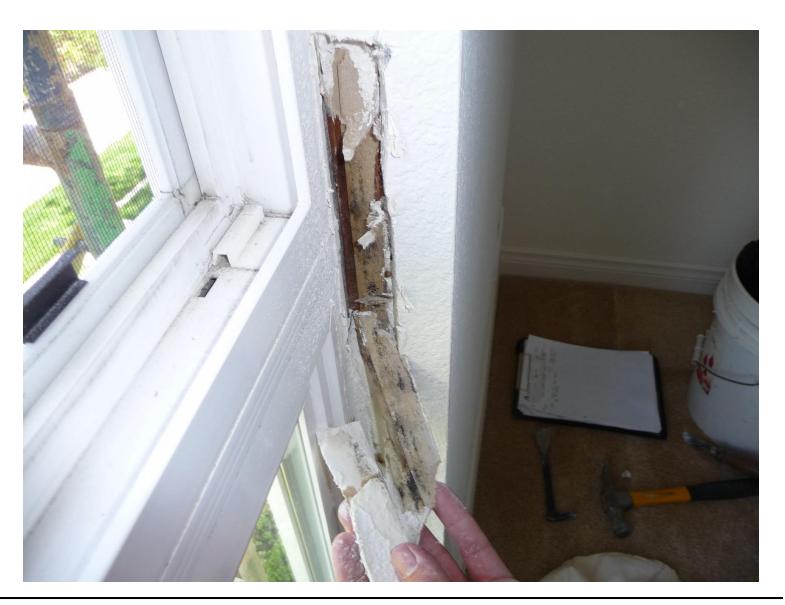

Coped Joint Issues

- Assembly has continuous frame along entire perimeter.
- Horizontal mullion attaches to perimeter framed with a coped joint.
- This joint needs to be sealed and plugged.
- Extrusion of mullion is different than frame making transition complex and difficult to seal.
- Fastening of the mullion can end up in a drainage cavity, leading to corrosion of steel and fasteners.

Coped Intersection

Coped Mullion Issues

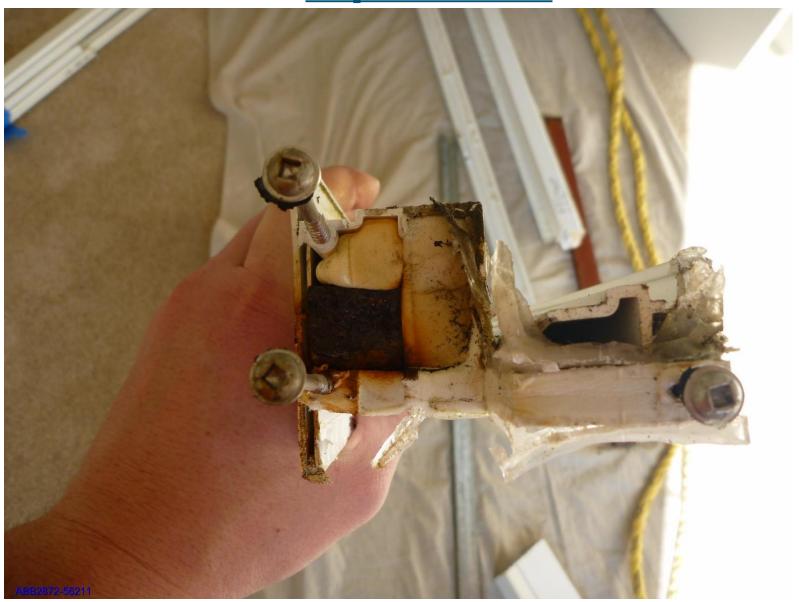

Avoiding Failures

Glazing Tape

- Avoid tape reliant glazing systems, where possible.
- If using a glazing tape assembly, reinforce with glazing gasketing.
- If using tape only, use exterior glazed systems.
- Review windows during construction and confirm tape adhesion and continuity.

IGU

 The less metal in the spacer, the less opportunity to condensation.

Frame Issues

Keep the window sizes within Manufacturer tolerances.

Avoiding Failures

Reinforcement

- Review shop drawings to confirm location and attachment of steel reinforcement. Steel shall not be in a drainage channel.
- Review shop drawings to confirm fastening and continuity of steel.
- Keep the big windows on the bottom.

Joinery - Mulled Windows

- Avoid them.
- If you can't avoid them, be sure to have the cap properly sealant and properly locate fasteners.
- Keep sizing within window tolerances. Keep window weights below 400 pounds.

Joinery - Coped Joints

- Seal transition with sealant and gasketed plug.
- Review shop drawings for coping fastener location to avoid drainage channels.

Objectives

- Some Fenestration Basics
- Progression from Aluminum to Vinyl
- Pros and Cons of Vinyl Windows
- Technical Aspects of Vinyl Windows
 - Design Considerations
 - External Glazed vs. Internal Glazed
 - How do Drainage Paths Work on Vinyl Windows?
- Understanding Why Vinyl Windows Fail
 - How are they Performing?
 - What is Failing?
 - What is Working?
- Case Study

Case Study 1

- Apartment project was built in 2007-08 and consists of 4-5 stories of wood frame construction over a post tensioned concrete podium containing a garage and retail shops.
- The project uses "fin" style vinyl windows and there are Juliette balcony railings with sliding windows and sliding glass doors at the courtyard entrances.
- The windows are vinyl casement windows with steel reinforced mullions
- ABBAE was retained to assist in analyzing window failures.

The Project, Case Study 1

Testing, Case Study 1

- ABBAE performed several air and water infiltration tests, reviewed shop drawings, conducted visual observations of interiors, and reviewed previous reports.
- ABBAE also had ASTM E1105.01 and ASTM E783.02 window tests completed.
- Since the windows immediately failed the water and air tests due to glazing seal related failure, we isolated the glazing failures and performed tests for other failures.

Glazing Failures

- Several windows tested leaked at glass-to-glazing bead junctures.
- The windows are interior glazed and have a poor quality acrylic adhesive closed-cell foam glazing tape. These seals have failed in all windows where the glazing was tested.
- Water Test Failure:
 - Windows were tested at 3.5 psf, 2/3^{rds} of the Manufacturer's stated performance standards.
 - Of the three windows that were tested without isolating the glazing, all three failed to pass. This is a 100% failure rate.

Glazing Failures And Resultant Leak

Glazing Failure Analysis

- The design of the windows caused premature failure of the glazing seals at the window-to-frame transition, and causes the windows to fail to perform. Design factors causing these failures are:
 - Glazing is installed from the interior, which causes the glazing tape to be the primary line of defense against water intrusion. The tape is susceptible to UV and heat degradation, is of inferior quality, and is not a long-term solution to this condition.
 - The window frame is designed with a horizontal flat surface at the frame-to-glass joint, so water sits in contact with the glazing tape, causing premature Insulated Glass Unit (IGU) failure.
 - Current glazing tape is an acrylic adhesive closed-cell foam tape that is compressed with glazing stops at the interior. In our testing, we observed that the tape did not make uniform contact with the glass thereby allowing water to bypass the tape altogether.
 - When the glazing seal fails, water flows into the sill tracks of each piece of glass. This is sometimes the upper lites that have a drained horizontal mullion, and sometimes it is the lower sill track that has no method of managing water that enters the frame at that location.

IGU Being Removed

Glazing Tape Is Discolored And Stained From Dirt And Water

Laboratory Testing For Air Tightness

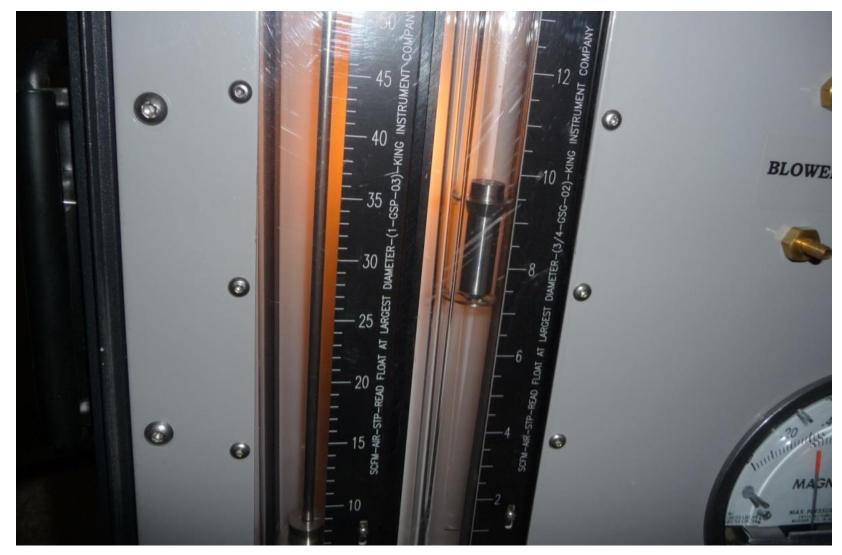

Glazing tape failure also causes Air-Leakage test failure:

- Due to failed glazing seals, windows tested (ASTM E 283-91) did not meet project specified air leakage performance standards.
- Of the seven windows tested for air leakage all seven failed to meet the air leakage standards in Manufacturer's shop drawings.
 This is a 100% failure rate.

Air Pressure Gauge In Action During Air Leakage Testing

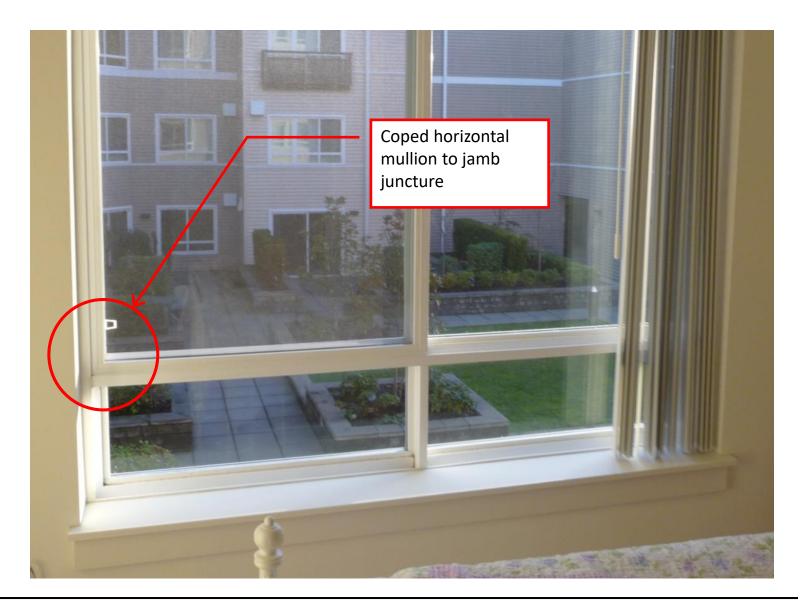

Case Study 1 In-Situ Air Leakage Test Chamber

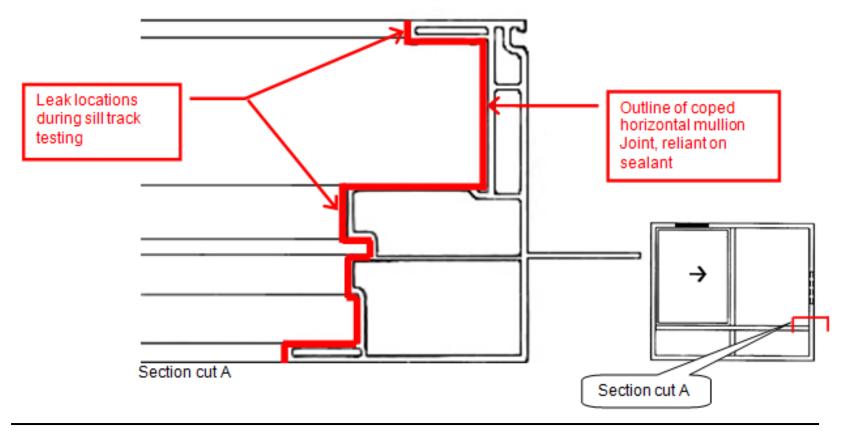

Case Study 1, Coped Horizontal Jamb Juncture

Leak Location During Sill Track Testing

 The sealant-dependent coped joint in the horizontal mullion has failed and allows water to leak through this junction and accumulate in the lower fixed "dry" sill track, which is not designed to manage water.

The Coped Intermediate Horizontal Mullion Is Improperly Sealed

- The horizontal-to-vertical coped mullion-to-jamb extrusion joint was improperly sealed in the factory and the leaks at this juncture were not discovered until after all the windows had already been installed.
- The manufacturer responded to a warranty claim and attempted to repair this condition in the field by applying sealant and injecting foam at this juncture. The frame was sealed with silicone sealant from the exterior of the joint at the positive and negative side of the seam and a hole was drilled and expanding foam was injected blindly at this juncture.
- This method of sealing the joint was inadequate for longterm performance, had failed again resulting in more water leakage and damage to interior finishes.

Coped Joint Failure

A = Manufacturer attempted to seal leak by pumping foam at coped joint B = Clear silicone sealant, failed attempt to seal coped joint

<u>Staining From The Water In Contact With The Structural Reinforcing Causing It To Rust</u>

 Sealant is installed at underside of coped horizontal-tovertical mullion joint failed to stop leak. The leaks are rust staining from the structural steel reinforcement.

Window Drainage and Weeping Issues

• Water travels at the jambs and can rust the steel bar

Typical Build-Up Of Water in Lower Sill Track

 This buildup is the result of water standing in this nondraining track.

Water Intrusion-Damaged Wood Stool

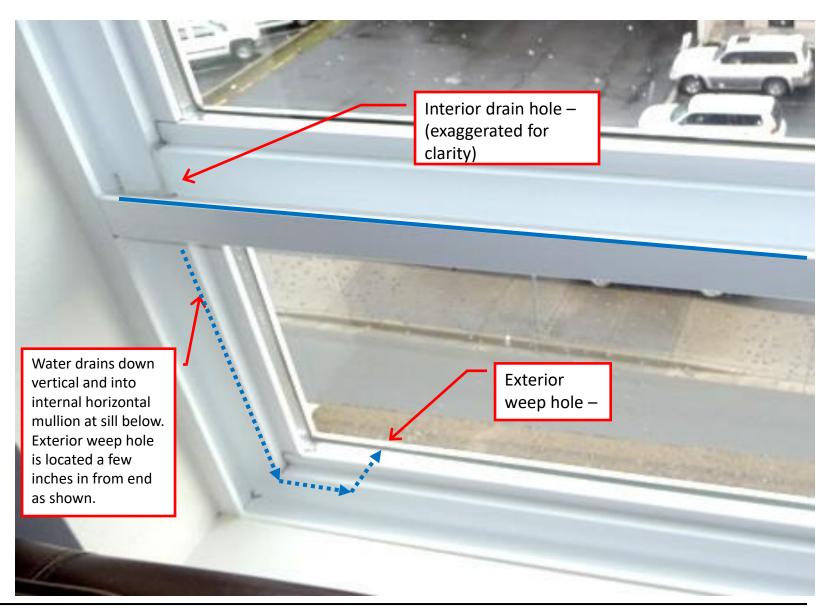

Improperly Constructed Weep Holes And Drainage Pathway

- Windows were manufactured with improperly constructed weep holes and drainage pathway.
- The weep holes were constructed with 5 mm diameter hole which encourages surface tension and prevents proper drainage down the pathway.
- According to the Glazing Association of North America, the minimum size of weep hole to prevent surface tension is 8 mm or 5/16th inch.

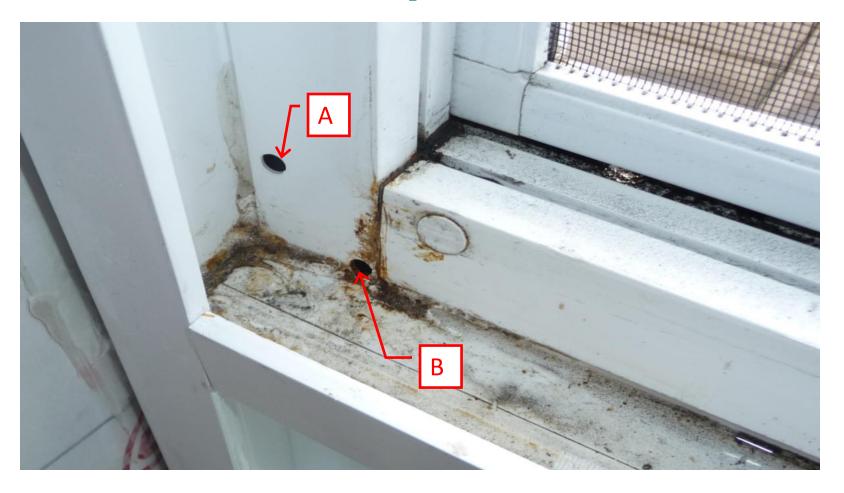

Case Study 1, Drainage Pathway Analyzed

Weep Holes

- A = Pressure relief/equalization hole (after the fact).
- B = Upper Drain Hole; drain hole is undersized and does not meet GANA minimum weep hole size of 5/16" (8mm). Drain holes measured are 5 mm in diameter.

Interior and Exterior Weeps

Exterior weeps are $\frac{1}{4}$ " high by $\frac{3}{8}$ " wide.

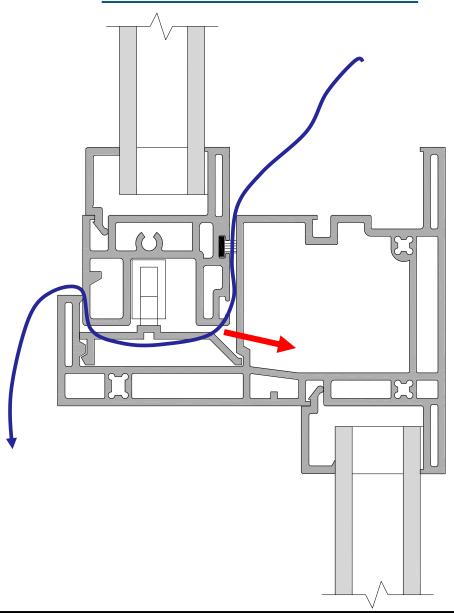

Drainage Defect Condition

- Due to the above weep hole and drainage pathway construction the windows failed to perform per the manufacturer's performance requirements.
 - Windows were tested at 3.5 psf, 2/3^{rds} the Manufacturer stated performance standards at all windows where glazing was isolated from testing.
 - We isolated the glazing-to-frame connections to test only the frame conditions.
 - Water rushed into the frame from the operable sash-to-horizontal transom bar track.
 - Initially water was blown onto the stool through percolation, then water overwhelmed the intermediate transom and poured into the sill track and splashed onto the wood stool.
 - Once the sill track was overwhelmed the water flowed onto the wood stool.
 - Of the 13 ASTM E1105 water tests conducted at windows with the above described drain pathway construction, all 13 failed to pass the test.

Horizontal Mullion

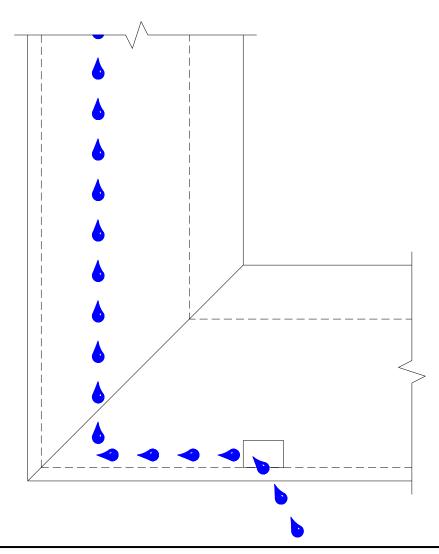

Drainage Testing Results - Continued

Elevation

Conclusion, Vinyl Windows

- Properly designed and manufactured windows seem to work well and are performing.
- Pre-mature failures are mostly due to poor manufacturing techniques and poor design
- Cheaper materials within a window system can cause premature failures
- Vinyl windows must be limited to smaller size openings
- Mulling smaller windows together to form a large window has inherent issues and risks

Conclusion, Vinyl Windows

- Specify window sizes appropriate for the project
- Intermediate frame joints in window are usually not welded and often fail due to poor sealing techniques.
- Vinyl frames can be wavy and are more difficult to seal against glass because glass is flatter than the frame
- Glazing seals used in vinyl windows is often a foam tape which can fail due to UV, long term exposure to water and waviness of vinyl frames

Thank You!
